

## FIRING POSITIONS - Small Arms

General: Foxholes are the preferred firing position for this range. The range is used for rifle training and qualification requirements. Foxhole locations must provide realistic fighting positions for the soldier and a clear line-of-sight to the infantry target arrays down range. The firing line can be raised, which provides two advantages. A raised firing line provides better line-of-sight to the targets from the firing position. It also provides good drainage away from the foxhole position. The firing positions should not be raised above a height higher than that which would provide adequate drainage. The foxhole can be a one-man precast concrete manhole foxhole (shown above left) or a walk-in firing position (shown above right). A prone position is adjacent to the foxhole position. See the Civil Details and drawing CD – 09 in the Appendix of this document for more details on the one and two man fox holes.
